Experiment 1 - Simple Statements and Expressions

Python Lab Manual — Program and Output

EX. NO: 1(a) — Exchange the values of two variables

PROGRAM

```
a = int(input("Enter the value of A: "))
b = int(input("Enter the value of B: "))
a, b = b, a
print("The swapping of a value is", a)
print("The swapping of b value is", b)
```

OUTPUT

```
Enter the value of A: 5
Enter the value of B: 4
The swapping of a value is 4
The swapping of b value is 5
```

EX. NO: 1(b) — Calculate the distance between two points

PROGRAM

```
import math

x1 = int(input("Enter the value of x1 = "))
x2 = int(input("Enter the value of x2 = "))
y1 = int(input("Enter the value of y1 = "))
y2 = int(input("Enter the value of y2 = "))

dx = x2 - x1
dy = y2 - y1
d = dx**2 + dy**2
result = math.sqrt(d)
print(result)
```

OUTPUT

```
Enter the value of x1 = 5
Enter the value of x2 = 6
Enter the value of y1 = 6
Enter the value of y2 = 3
3.1622776601683795
```
